To whom it may concern

Eric LaMar started on my team in January of 2015 just as we were ramping up a high-priority and very time-constrained project. We hired him for his expertise with volume rendering, and he was quickly able to make contributions to our code, and train the team in what he had done. Due to the needs of the project, he transitioned to working on other aspects of the code, ramping up on several new technologies, and spearheading getting our code running on Mac. This required him to learn a new platform with no guiding expertise within the company, and parse through a significant amount of undocumented legacy code - no small feat. The project could never have shipped on time without his help. As it turned out, the product was very successful with customers, and the sales team reported it as the most significant revenue increase for all products that year.

As the project moved into maintenance mode, Eric was moved to another team, but I would have preferred to keep him on as an excellent asset. His hours were dependable and his work ethic excellent. His main strengths as they applied to my team are in code and algorithm design and implementation in C++ on the Mac and Windows platforms, bug testing and fixing, documenting changes, and some UI work with Qt.

Eric would make an excellent addition to any team, and I would happily work with him again. If you have any questions, please call (650) 600-1358.

Sincerely,

Alethea Bair-Sutherland
